

1. Tell us about yourself

I am a third-year Information Technology student at the Cape Peninsula University of Technology, majoring in Applications Development. Throughout my studies, I have focused on how technology can make systems more efficient and user friendly.

I have worked on a few academic projects, including a web-based restaurant management system, which helped me understand both front-end and back-end development. I enjoy solving problems through coding and seeing how the technical side supports business goals.

I would describe myself as detail oriented, curious, and someone who learns best through practical experience. That is why I am excited about the opportunity to complete my Work Integrated Learning at Woolworths.

2. Why did you choose IT, and what interests you most about this field

I chose Information Technology because it combines logic with creativity. There is always something new to learn, whether it is a new programming framework, a more efficient way to design systems, or an improved method to manage data.

What interests me most is applications development. I enjoy building systems that people actually use. Turning requirements into functional applications and improving how users interact with technology is what motivates me.

3. Why Woolworths

Woolworths stands out to me because it values quality, innovation, and sustainability. It is more than just a retail brand. It is a company that is transforming digitally, and that is what attracted me.

I have seen how Woolworths is investing in technology through its online shopping systems and customer experience tools. I would like to learn how IT supports such a large business. I also appreciate that Woolworths provides a structured environment where students can apply what they have learned in real-world projects.

4. Tell us about a project you have worked on

One of my main projects was a restaurant management system that I developed as part of a consultancy project. It was designed to help restaurants manage bookings, staff schedules, and menus.

I worked on both the front-end and the back-end. On the front-end, I used HTML, CSS, and JavaScript. On the back-end, I used PHP and MySQL for database management.

The project taught me about user experience, data validation, and system design. It also showed me how important testing is and how small coding errors can affect the overall functionality of a system.

5. What technical skills do you have

I am most confident in the following areas:

- Programming languages: Java, Python, and PHP
- Web development: HTML, CSS, and JavaScript
- Database design and management: MySQL and SQL Server
- Version control: Git and GitHub
- System analysis: creating ERDs, UML diagrams, and use case models

I also have experience gathering requirements and documenting system specifications. This has helped me understand both the technical and communication sides of IT projects.

6. How do you handle challenges or being stuck on a problem

When I face a challenge, I start by breaking the problem down into smaller parts so I can identify where things are going wrong. If I still cannot solve it, I look for possible solutions online or review the documentation.

If that does not work, I ask for help from someone more experienced, but only after I have tried different approaches on my own. I have learned that collaboration and persistence are key in development. Most problems can be solved with enough patience and analysis.

7. What do you hope to gain from this Work Integrated Learning experience

I want to gain real-world experience in a professional IT environment and see how development teams operate in a business setting.

I hope to strengthen my technical skills and learn how to apply what I have studied to actual business problems. Most importantly, I want to contribute value by supporting the team and learning from every project I am involved in.

8. Why should we choose you

I am dedicated, eager to learn, and not afraid of hard work. I take initiative and pay attention to detail, whether it involves debugging code or documenting requirements.

I believe I would fit well into Woolworths' culture because I am professional, reliable, and passionate about using technology to improve processes. I may still be a student, but I bring a strong work ethic and genuine enthusiasm to everything I do.
